

FRANCHISING

The Franchising module targets franchising customers looking for a simple, fast-implementing product and which comprises the main operational and managerial routines of your business.

Through a proposal seeking to attend to the franchised with a lightweight and functional module, the Franchising module complements the package of ERP Linxsystem modules targeting store operations.

Both LinxPOS and LinxPOS Manager – outlet-oriented Linx products – are jointly installed with the Franchising module and strictly comply with fiscal legislation.

The Franchising module may be installed at the very outlet or an office, receiving store data exchanged with the franchiser.

One of the greatest differentials in this module is concentrating on its ease of relationship between franchise and franchiser. Among other functionalities we can highlight speed at generation of sales orders carried out by the franchise with franchiser in Franchising module purchasing orders.

Perfect module structuring and integration between them allow such information synchrony as product and price register, avoiding re-work for the Franchise. Sales and stock are data sent to the franchised, favoring commercial analyses and making products reposition easy.

The Franchise will also be able to count on store sales performance consultations, products and their attributes, salesclerks, control over stock and periodical inventories, financial consultations, and purchasing follow-up.
